

Annual Census of Mines & Industrial Consumption of Energy Survey

Two external reports with sections related to energy consumption are the Annual Census of Mines (administered by Natural Resources Canada) and the Industrial Consumption of Energy (ICE) survey (administered by Statistics Canada). These surveys are to be completed at the site level. Data reported within these surveys are used by governments to develop energy related policy, and are one input used to estimate sectoral emissions of GHG and criteria air contaminants. It is very important that the data reported in these surveys is accurate so that government policy decisions are based on real data. These surveys should be completed using the same data compiled for the corporate GHG emissions inventory. The template presented in Section 2 has been aligned with the reporting requirements of these two surveys.
